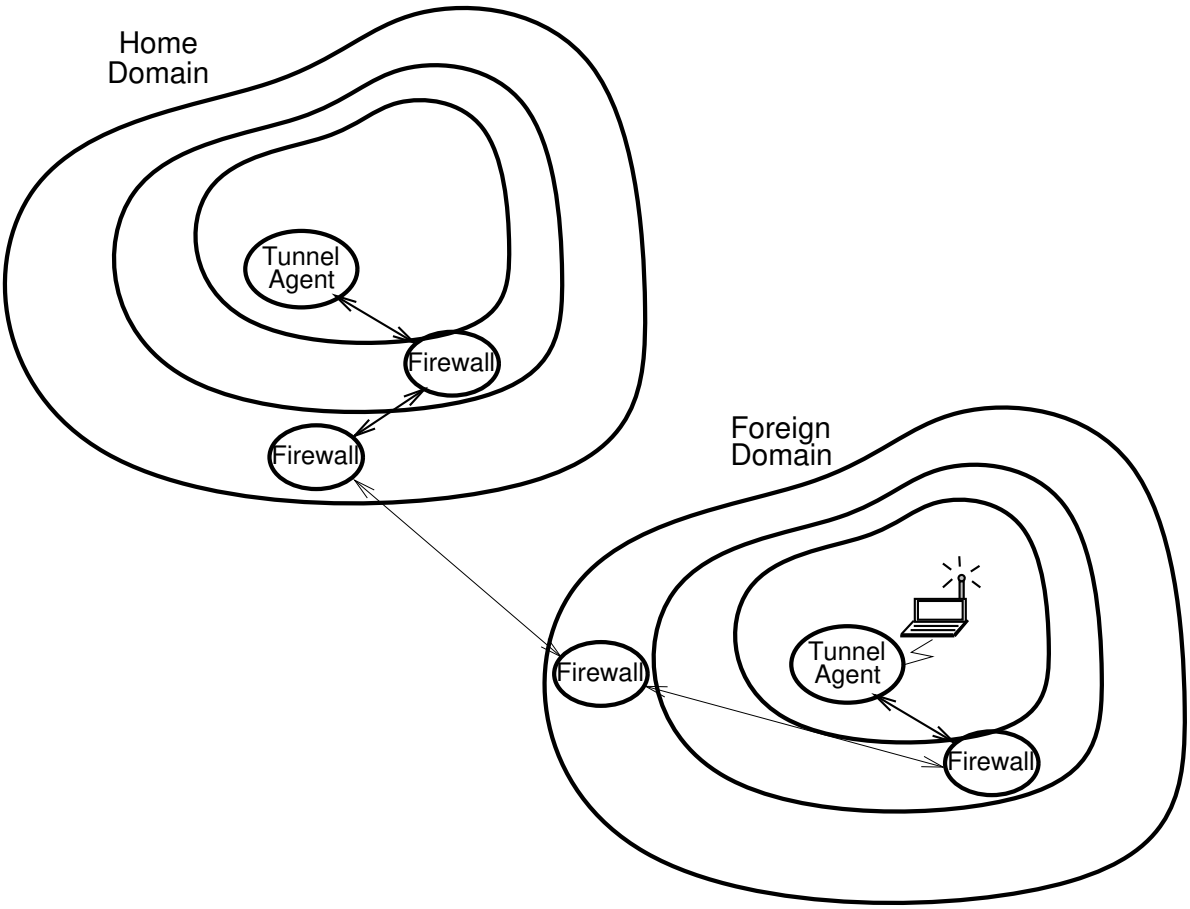
Tunneling between two domains



The PDU receiver in the foreign domain should know (by advertisement or preconfiguration) the agent hierarchy in its home domain.

Firewalls have to be tunnel agents, or effectively managed by tunnel agents.

Transitivity of Trust

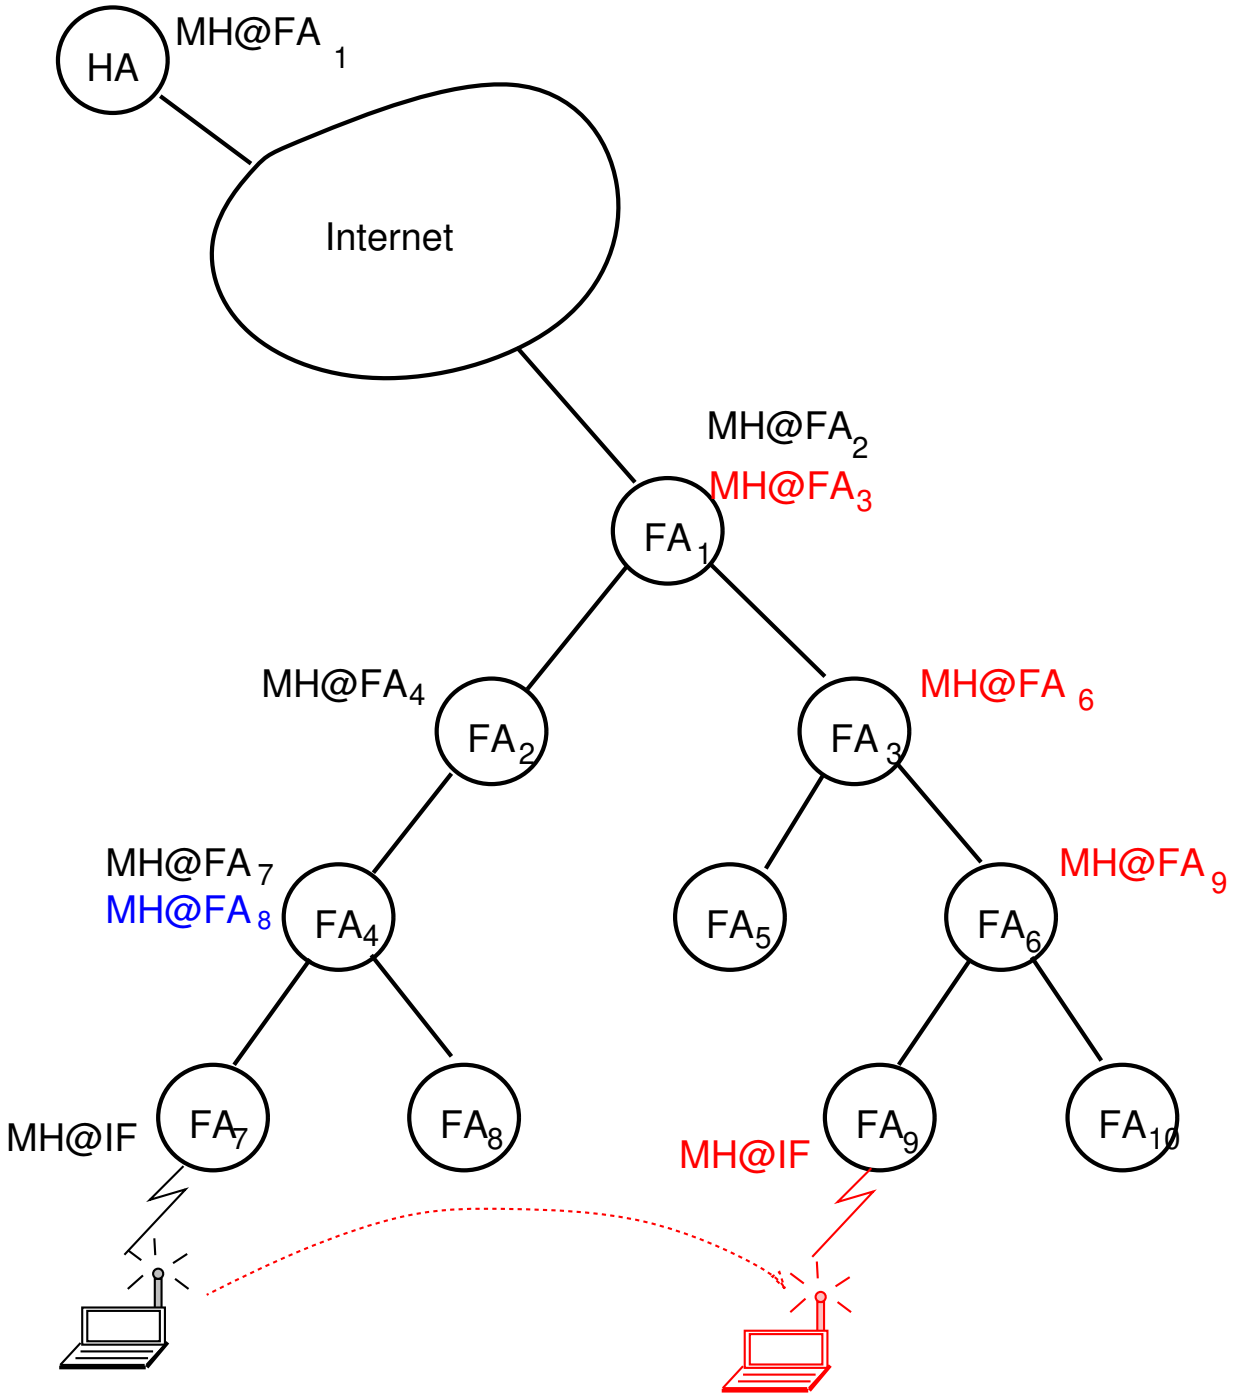
Agents in two domains have to have a point of trusted contact. TEP is constructed to allow the requesting tunnel agent utilize a trust relationship between a PDU receiver and a targeted tunnel agent.

In addition, trust relationships at other levels of the hierarchy can be used.

TODO: enable association of tunnel parameters at each tunnel stage (may require iterated encapsulation)

- Security needs careful attention
  - Establish session key, as outlined in Route Optimization
- Each requesting tunnel agent considers the PDU receiver to be registered at tunnel agent just below it in the hierarchy
- Tunnel Requests passed from level to level
- Likewise for Tunnel Replies

Hierarchical agents



Previous idea: make Registration Requests go only as far as needed up a hierarchy of Foreign Agents

TEP terminology

- targeted tunnel agent (like a home agent)
- requesting tunnel agent (like a foreign agent)
- PDU receiver (like a mobile node)

TEP is especially oriented to allowing a multiprotocol tunnel agent (a "foreign agent") request a tunnel on behalf of some node that does not necessarily

TEP *should* be constructed so that the established tunnel is bidirectional. This is under evaluation.

TEP source material

TEP has been synthesized from several existing and outdated drafts

- Virtual Private Networking
- Integrated Mobility Extension
- Tunnel Setup Protocol
- Hierarchical Foreign Agents
- RFC 2002

The process of integration is still ongoing.

Agent Advertisement is not part of TEP, but would be exactly like previous Hierarchical Foreign Agents draft for IP-aware requesting nodes. Alternatively, could try to define solicitations non-IP nodes, or advertisements for them, but this leads too far afield.

Tunnel Establishment Protocol (TEP)

Intended to serve a variety of tunnel establishment needs in a consistent way

- multiprotocol tunneling
- multilevel security domains
- virtual private networks

This is a demanding set of requirements

Tunnel Establishment Protocol
